

We are happy to share the news about MasterLink's new version, released this month. This version features a new function called "Import", and an updated user interface enabling continues & fluent linking process. We see it as yet another step in creating a great work environment for project managers and Project users utilizing MasterLink's enhanced capabilities.

A new function added to MasterLink

This new function helps users quickly create Master Schedules or other required integrated files, based on information that already exists in other workplans, while saving the user the need to type the information. The "import" function allows the users to copy tasks they wish to link to, and already exist in different work plans into their own project file without the need to retype them. By using Import, MasterLink will create the task in my workplan, with the exact name and data, along with an associated WorkPackage link. Import enables bulk copying of tasks from multiple projects in just one action.

Easier linking process!

Establishing several links becomes easier! From this version on the "New agreement Form" is opened on the right side of the screen and can remain open enabling the user to continuously create links (same process as before) without the need to reopen the form with each new link.
